How Was The Experiment Implemented?

Total Variant Visitors: 35,211

Total Control Participants: 34,678

Conversion Rates

	U.S.	U.K.	CA
Control	10.73%	10.16%	9.45%
Treatment	15.77%	14.87%	15.40%

Executive Summary: The treatment page is associated with higher conversion rates across all three countries compared to the control page. However, country alone does not appear to have significant impact on conversion rates.

Experiment Results

Treatment Conversion Rate: 15.53%
Control Conversion Rate: 10.53%
Delta in Treatment vs. Control Conversion Rate: 5.01%
p-value: 0.0
Conclusion: The p-value of 0.0 is less than the Type I error rate of 0.05, so we reject the null hypthesis. There is statistically significant evidence that the treatment page has a higher conversion rate than the control page.

Country Results

Conclusion: Based on the logistic regreassion mode, the p-values of US(0.170) and UK(0.905) are both greater than 0.05, so we fail to reject the null hypothesis of both. There are no statistically significant differences in conversion rates between countries. Country does not appear to meaningfully impact whether a user converts.
